

### ***Abstract of the Disclosure***

An apparatus has been invented for the enclosure of electronic devices, electronics, electronic circuits and other materials, which provides for the apparatus to be supported or attached to a plurality of surfaces such as desktops, bulkheads, walls, panels, connectors, racks, structures and appendages. Such an apparatus also allows for the alignment and orientation of such enclosures to each other and other surfaces, allowing for multiple units to be manipulated as one assembly. The apparatus is also ergonomically correct for human hands in size, shape, texture and contour.
